Mass parameters were generated from quadratic growth curves, wing length parameters were generated from logistic growth curves, and p10 length parameters were generated from extreme value function (EVF) growth curves. Growth rate and normalized growth rate are constants. Asymptote is given in grams (g) for mass and mm for wing and p10 length. Inflection points are given in mm. Values with \* were generated separately with the *nls* function. Individuals without values (—) either did not have sufficient data (p10 length:  $n = 2$ ) or did not have data that produced a realistic fit to the chosen model (mass:  $n = 1$ , p10 length:  $n = 3$ ).
